TASK 4

1. Objective

To configure a Windows inbound firewall rule to block Telnet traffic on TCP port 23, and check connectivity from Kali Linux. UFW was also configured on Kali Linux.

2. Lab Environment

Host system	Windows
Testing system	Kali Linux (Oracle VirtualBox)
Firewall tools	Windows Defender Firewall / UFW
Connectivity tool	Netcat (nc)
Ports checked	TCP 22 (SSH) and TCP 23 (Telnet)

3. Work Performed

- Tested TCP port 23 from Kali Linux before applying the Windows rule.
- Created an enabled Windows inbound rule named Task4_Block_Telnet_23 to block TCP local port 23 for Domain, Private and Public profiles.
- Configured Kali UFW to allow TCP 22, deny TCP 23, deny incoming traffic by default and allow outgoing traffic.
- Reviewed Windows firewall settings and repeated the connectivity test.

4. Test Results and Observations

Check	Observed result	Interpretation
Initial TCP 23 test	Connection open	A service was accepting connections before the Windows rule was configured.
Windows rule	Enabled; Block; TCP 23	The inbound rule was created with the intended settings.
Post-change test	Connection refused	No service accepted the connection at that moment; this alone does not prove firewall blocking.
McAfee notice	McAfee Personal Firewall managing settings	Windows Defender rule enforcement may be affected by the vendor firewall.
Kali UFW	Active; allow 22/tcp; deny 23/tcp	The displayed UFW rules were active on Kali Linux.

Overall finding:

The Windows rule is configured, but successful blocking was not conclusively verified. Windows displayed a notice that McAfee Personal Firewall was managing the settings. Kali UFW is a separate firewall and its rules apply to Kali Linux, not to inbound traffic on Windows.

5. Screenshots and Evidence

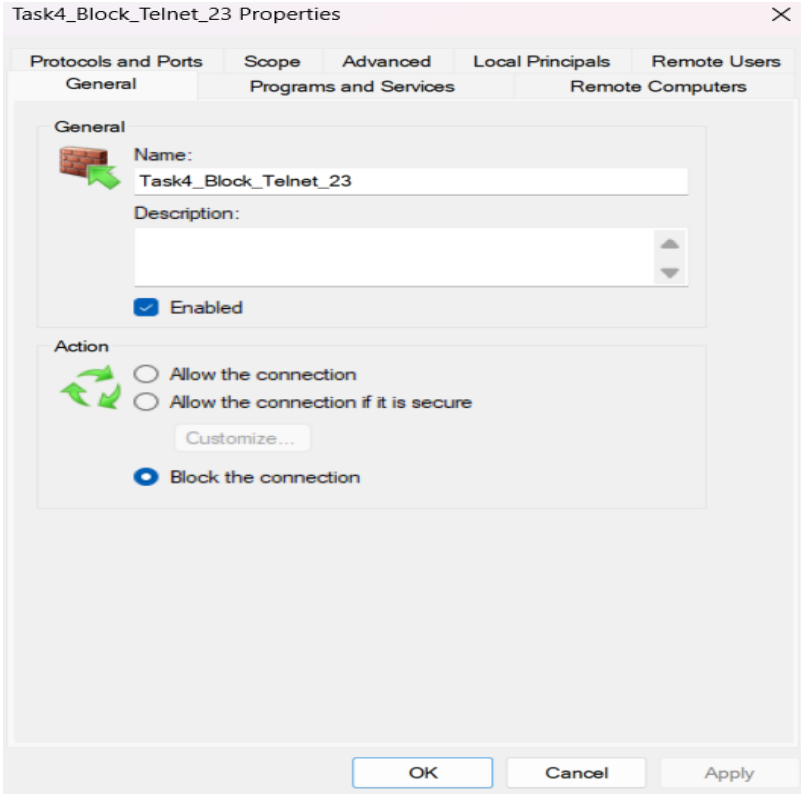

5.1 Initial connectivity test — TCP 23

This is the initial Kali Linux test. Netcat reported the Telnet port as open before the Windows blocking rule was configured.

5.2 Windows inbound rule — Block connection

The Windows rule is enabled and the selected action is Block the connection.

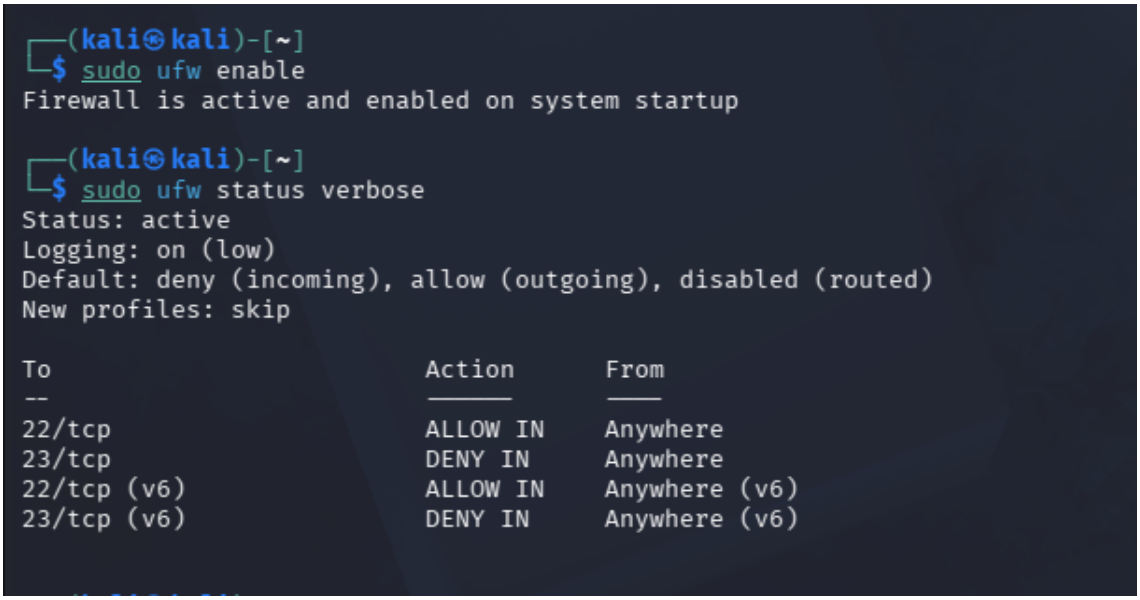

5.3 Windows firewall profiles

The rule is configured for Domain, Private and Public profiles.

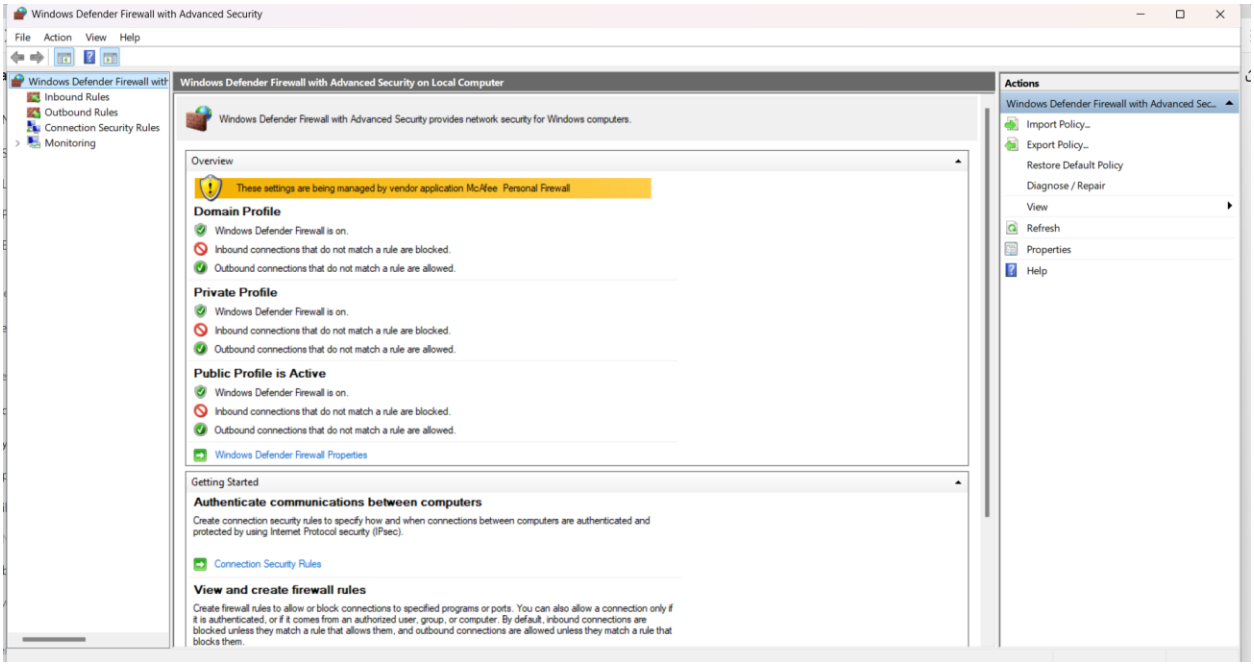

5.4 Kali UFW status

UFW is active. The displayed rules allow TCP 22 and deny TCP 23.

5.5 Firewall management notice

Windows Firewall with Advanced Security displayed a notice that McAfee Personal Firewall was managing the settings.

5.6 Kali connectivity test after rule changes

Netcat returned Connection refused. This confirms that the connection was refused at that time, but does not by itself establish that the Windows firewall rule caused it.

6. Conclusion

The practical covered Windows inbound firewall configuration, Kali Linux connectivity testing and UFW rule management. The Windows block rule was created with the requested settings, but the evidence does not conclusively prove that Windows blocked TCP 23. The McAfee firewall management notice should be resolved before repeating the test with a confirmed listening service.
